

Reckless mode—disabling typechecking

[/Reference manual](#)/[Tool directives](#)

Typechecking can be disabled by engaging reckless mode. This disables the reports that would otherwise be emitted by the typechecker, and prevents addition of declarations to the top-level environment. Reckless mode should be used in only exceptional circumstances, such as in the preparation of pedagogic examples of what not to do.

The troff mark-up for enabling reckless mode and subsequently disabling it is as follows, on lines by themselves.

```
.ZR 1
...
.ZR 0
```

The L^AT_EX mark-up for enabling reckless mode and subsequently disabling it is as follows, on lines by themselves.

```
%%reckless 1
...
%%reckless 0
```

Latex mark-up provides an alternative notation: appending a `*` to the end of the environment name, for example `\begin{schema*}...\end{schema*}`, causes cadiz to ignore the enclosed paragraph, while L^AT_EX still typesets it.
