

context

[/Reference manual/Z-related commands/Browsing commands](#)

When *context* is applied to an error or warning report, it selects the formula to which that report relates.

When *context* is applied to a leaf node in the proof tree, it selects the corresponding goal.

When *context* is applied to a non-leaf node in the proof tree, it selects the formulae to which the command currently shown in the proof tree was applied, which will include one or more selections in the corresponding goal.

When *context* is applied to a node in a dependency graph, it selects the corresponding declaration.
