

Uses that are not typeset

The possible causes of a use not being typeset are as follows.

- The use might not have been typeset because of [quiet mode](#).

- The use might be within default abbreviated notation.

In other words, it might be in a generic name's omitted instantiation list (which can be revealed by the [instantiation](#) command) or in the characteristic tuple of an omitted \bullet part (which can be revealed by the [characterization](#) command).

- The use might be implicit in a theta expression or schema predicate, in which case it can be revealed by [expansion](#) commands.
