

section `standard_toolkit`

[/Reference manual/Standard toolkit](#)

1. Introduction

The mathematical toolkit is an optional extension to the compulsory core language. It comprises a hierarchy of related sections, each defining operators that are widely used in common application domains.

The division of the mathematical toolkit into separate sections allows specific ones to be reused or replaced. For example, *sequence_toolkit* could be bypassed if not needed, and *function_toolkit* could be replaced without affecting *number_toolkit*.

A specification without a section header has section *standard_toolkit* as parent by default.

2. Standard toolkit

section *standard_toolkit* parents *sequence_toolkit*

The standard toolkit contains the definitions of section *sequence_toolkit* (and implicitly those of its ancestral sections).
