

Searching the documentation

There is a shell script in the \$CADIZ/mip/bin directory for searching through all the web pages of documentation about CADiZ. It is called **crawler** and expects a single command-line argument that is a regular expression, in the style of `grep(1)`, as in the following example.

```
crawler "inference rule"
```

This script runs a web browser, showing a list of the titles of web pages that contain text matching the regular expression. The web browser chosen is that named by the environment variable \$WEBBROWSER, default netscape.

Ideally, this web page would offer a form to initiate a search. However, I cannot be sure that your web server will have access to this documentation, and indeed my web server doesn't have access to the master copy of the documentation.
