

other attempts

[/Reference manual](#)/[Z-related commands](#)/[Proof management commands](#)

The *other attempts* command is applicable to a node in the proof tree that has an ellipse drawn around it. It offers a menu of other attempts that have been made to prove the goal corresponding to this node in the tree, each identified by the name of a command that was applied to the goal. The proof tree is then redrawn showing the chosen attempt in place of the one previously displayed. There can be duplicates in the menu if the same command has been applied in more than one way—trial and error will find the relevant one.
