

## unlift

[/Reference manual/Z-related commands/Proof management commands](#)

The *unlift* command unfolds that part of the proof tree that was folded away by a *lift* command. It is applicable to a *lift* node in the proof tree. The lifted view is not forgotten, but rather continues to be remembered as just another proof attempt. This can be accessed by the *other attempts* command, or of course the lift can be repeated.

*IT 11-Oct-1997*
